Allowing registered AAD apps	.4
Locate tenant information	.4
Run admin consent	.5

## Allowing registered AAD apps

To enable the Azure Active Directory (AAD) integration that has been created for your InEight application, it is sometimes necessary to perform an Admin Consent to allow the application to work with your corporate AAD Tenant. If it is determined that an admin consent needs to be performed, you will need to provide the Tenant ID for the AAD tenant you want the InEight application to interact with.

#### Locate tenant information

To find your Azure Tenant ID, go to <u>https://portal.azure.com</u> and log in as a user with Global Admin permissions.

- 1. In the Favorites column, select Azure Active Directory.
- 2. In the Manage column, select **Properties**.
- 3. In the Directory Properties page, copy the **Directory ID.** This is your **Tenant ID**.

#### Run admin consent

**NOTE:** The Client ID will be provided by the InEight Services consultant along with a copy of this document.

To enable admin consent, build and run the following URL in a browser using your Tenant ID, as described in the previous section, and your Client ID that is provided by InEight.

https://login.microsoftonline.com/<TenantID>/adminconsent?client\_id=<ClientID>&state=12345

1. Paste the admin consent URL into the browser, and then press Enter.

The page is redirected to Microsoft to pick an account. Use an account that has Azure Tenant Admin privileges, and then login with the username and password.

2. Click Accept in the Permissions requested dialog box.

The result is you are redirected to an unreachable URL.

3. Go to Azure Portal > Enterprise Applications, and then search for the InEight AAD Registered App ID. The ID should be in the list of apps under Enterprise Application – All applications.
