21.3.3 Release Notes

NOTE:

Included are notable fixes or updates in stated products. If no notes are displayed for a product, this means that there are no notable changes.

Contract

- In certain instances, a PCO did not include pricing information from an issue because of an internal ID discrepancy.
- When a large number of users were simultaneously retrieving project member information, the response was slow. Performance has been improved.
- The Quantity cell in the import template had cell validation set to only add 6 digits before the decimal. Cell validation has been changed to support decimal (16,5) values in the same way as other decimal input cells do in Excel.
- In a Proxy ERP environment, when the invoice amount received was \$0, the system was ignoring the payment response. This condition has been removed.
- The Custom list drop-down values in the Contract header were being cut off. The text container's width has been increased.

Control

- When the budget was locked, current budget cost values were not populated. The current budget cost data is now populating correctly.
- The Excel import would at times not complete due to the process taking too long. Performance has been improved.
